

[POWER COMMANDER V]

2009 Suzuki DL1000

Installation Instructions

PARTS LIST

- 1 Power Commander
- 1 USB Cable
- 1 CD-ROM
- 1 Installation Guide
- 2 Power Commander Decals
- 2 Dynojet Decals
- 2 Velcro
- 1 Alcohol swab

**THE IGNITION MUST BE TURNED
OFF BEFORE INSTALLATION!**

YOU CAN ALSO DOWNLOAD THE
POWER COMMANDER SOFTWARE AND
LATEST MAPS FROM OUR WEB SITE AT:
www.powercommander.com

PLEASE READ ALL DIRECTIONS BEFORE STARTING INSTALLATION

Dynojet

2191 Mendenhall Drive North Las Vegas, NV 89081 (800) 992-4993 www.powercommander.com

POWER COMMANDER V INPUT ACCESSORY GUIDE

Wire connections:

To input wires into the PCV first remove the rubber plug on the backside of the unit and loosen the screw for the corresponding input. Using a 22-24 gauge wire strip about 10mm from its end. Push the wire into the hole of the PCV until it stops and then tighten the screw. Make sure to reinstall the rubber plug.

NOTE: If you tin the wires with solder it will make inserting them easier.

ACCESSORY INPUTS

Map -

The PCV has the ability to hold 2 different base maps. You can switch on the fly between these two base maps when you hook up a switch to the MAP inputs. You can use any open/close type switch. The polarity of the wires is not important. When using the Autotune kit one position will hold a base map and the other position will let you activate the learning mode. When the switch is "CLOSED" Autotune will be activated.

Shifter-

These inputs are for use with the Dynojet quickshifter. Insert the wires from the Dynojet quickshifter into the SHIFTER inputs. The polarity of the wires is not important.

Speed-

If your application has a speed sensor then you can tap into the signal side of the sensor and run a wire into this input. This will allow you to calculate gear position in the Control Center Software. Once gear position is setup you can alter your map based on gear position and setup gear dependent kill times when using a quickshifter.

Analog-

This input is for a 0-5v signal such as engine temp, boost, etc. Once this input is established you can alter your fuel curve based on this input in the control center software.

Crank-

Do **NOT** connect anything to this port unless instructed to do so by Dynojet. It is used to transfer crank trigger data from one module to another.

- 1 Remove the main seat and the passenger seat.
- 2 Remove the black, left hand, side fairing (Fig. A)

- 3 Route the wires from the PCV under the fuel tank bracket and go towards the front of the bike on the left hand side of the engine (Fig. B)

- 4 Unplug the connector from the throttle bodies (Fig. C).
This 6 pin BLACK connector is located on the L.H side of the engine behind the frame rail.

- 5 Plug the PCV in-line of the stock wiring harness and throttle body harness (Fig. D).

- 6 Attach the ground wire from the PCV to the negative side of the battery (Fig. E).

- 7 Install the PCV in the tail section using the supplied velcro. Make sure to clean both surfaces with the alcohol swab before attaching (Fig. F).

Speed input - BLACK wire of 3 pin BLACK connector from sprocket cover

Temperature input - BLK/BLU wire of temp sensor or rear cylinder, near rear throttle body

12v source for Auto tune - BROWN wire for tail light connector
